#### Abstract

In this paper, we prove some common fixed point theorems for weak** commuting mappings in fuzzy 2-metric space without continuity condition.

## I. INTRODUCTION

The idea of fuzzy metric space was introduced by Kramosil and Michalek [4] which was, later on, modified by George and Veeramani [2]. Many authors like Jungck and Rohades [3], Vasuki [12], Singh and Jain [11] used the concept of R-weakly commuting mappings and weak-compatible mappings to prove fixed point theorems in fuzzy metric spaces. The notion of weakly commuting introduced by Seesa [9] was improved by Pathak [5] by defining weak* commuting and weak**commuting mappings in metric spaces and prove some fixed point theorem.

Recently Singh and Jain [11], prove a unique common fixed point theorem in fuzzy metric space for four mappings with implicit relations including continuity condition. In this paper, with the concepts of weak** commuting, we prove some common fixed point theorems in fuzzy 2-metric space by using implicit relation without continuity condition.

## II. PRELIMINARIES

In this section we start some definitions and known results which will be used in the proof of main result.

Definition 2.1. The 3-tuple ( $\mathrm{X}, \mathrm{M},{ }^{*}$ ) is called a fuzzy 2-metric space if $X$ is an arbitrary nonempty set,* is a continuous $t$-norm and M is a fuzzy set in $X^{3} \times[0, \infty)$ satisfying the following conditions, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{X}$ and $\mathrm{t}>0$ :
(FM-1) $\quad \mathrm{M}(\mathrm{x}, \mathrm{y}, \mathrm{z}, \mathrm{t})>0$,
(FM-2) $\quad \mathrm{M}(\mathrm{x}, \mathrm{y}, \mathrm{z}, \mathrm{t})=1$ iff at least two out of three Points are equal,

$$
\begin{aligned}
&(\text { FM- } 3) \quad M(x, y z, t)=M(x, z, y, t) \\
&=M(y, z, x, t) \\
&(\text { FM-4) } \quad M\left(x, y, z, t_{1}+t_{2}+t_{3}\right) \\
& \geq M\left(x, y, u, t_{1}\right) * M\left(x, u, z, t_{2}\right) \\
& * M\left(u, y, z, t_{3}\right), \text { for } t_{i}>0
\end{aligned}
$$

(FM-5) $\quad \mathrm{M}(\mathrm{x}, \mathrm{y}, \mathrm{z} \cdot):(0, \infty) \rightarrow[0,1]$ is left continuous,
(FM-6) $\quad \lim _{t \rightarrow \infty} \mathrm{M}(\mathrm{x}, \mathrm{y}, \mathrm{z}, \mathrm{t})=1$.
Definition 2.2. A pair (A, S) of self maps of a fuzzy 2 -metric space $\left(\mathrm{X}, \mathrm{M},{ }^{*}\right)$ is said to be weak** commuting if $A(X) \subset S(X)$ and for all

## $\mathrm{x} \in \mathrm{X}$,

$$
\begin{aligned}
\mathrm{M}\left(\mathrm{~S}^{2} A^{2} v, A^{2} S^{2} v, z, t\right) & \geq \mathrm{M}\left(\mathrm{~S}^{2} A v, A^{2} S v, z, t\right) \\
& \geq \mathrm{M}\left(\mathrm{SA}^{2} v, A S^{2} v, z, t\right) \\
& \geq \mathrm{M}\left(\mathrm{SAAv}^{2} \mathrm{ASv}, \mathrm{z}, \mathrm{t}\right) \\
& \geq \mathrm{M}\left(\mathrm{~S}^{2} v, A^{2} v, z, t\right) .
\end{aligned}
$$

If $A^{2}=A$ and $S^{2}=S$ then the weak** commutative reduces to weak commutative.
2.3. A class of implicit function: Let $\Phi$ be the set of all real continuous functions $F:\left(R^{+}\right)^{5} \rightarrow R$, non decreasing in the first argument satisfying the following conditions:
(a) For $u, v \geq 0, F(u, v, u, v, 1) \geq 0$ implies that $u \geq v$.
(b) $\mathrm{F}(\mathrm{u}, 1,1, \mathrm{u}, 1) \geq 0$ or $\mathrm{F}(\mathrm{u}, \mathrm{u}, \mathrm{u}, 1, \mathrm{u}) \geq 0$ or $F(u, 1, u, 1, u) \geq 0$ implies that $u \geq 1$.

## Example:

Define $F\left(t_{1}, t_{2}, t_{3}, t_{4}, t_{5}\right)=20 t_{1}-18 t_{2}+10 t_{3}-12$ $\mathrm{t}_{4}-\mathrm{t}_{5}+1$.

Lemma 2.4. If for all $x, y \in X, t>0$ and 0 $<k<1, M(x, y, k t) \geq M(x, y, t)$, then $x=y$.

Lemma 2.5 Let $\left\{y_{n}\right\}$ be a sequence in fuzzy 2-metric space ( $\mathrm{X}, \mathrm{M},{ }^{*}$ ) with the condition FM-6.If there exists $\mathrm{k} \in(0,1)$ such that $\mathrm{M}\left(\mathrm{y}_{\mathrm{n}}\right.$, $\left.y_{n+1}, z, k t\right) \geq M\left(y_{n}, y_{n+1}, z, t\right)$, for all $t>0$ and $\mathrm{n} \in \mathrm{N}$, then $\left\{\mathrm{y}_{\mathrm{n}}\right\}$ is a Cauchy sequence in X .

## III. MAIN RESULTS

Theorem 3. Let $A, B, T$ and $S$ be self mappings on a complete fuzzy 2 -metric space ( $\mathrm{X}, \mathrm{M},{ }^{*}$ ) satisfying the following
(i) $\mathrm{A}(\mathrm{X}) \subset \mathrm{T}(\mathrm{X}), \mathrm{B}(\mathrm{X}) \subset \mathrm{S}(\mathrm{X})$,
(ii) The pairs (A, S) and (B, T) are weak** commutative.
(iii) $\mathrm{T}(\mathrm{X})$ and $\mathrm{S}(\mathrm{X})$ are complete
(iv) For some $\mathrm{F} \in \Phi$, there exists $\mathrm{k} \in(0,1)$ such that for all $x, y, z \in X$ and $t>0$,
$F\left\{M\left(A^{2} x, B^{2} y, z, k t\right), M\left(T^{2} y, S^{2} x, z, t\right)\right.$, $M\left(A^{2} x, T^{2} y, z, t\right), M\left(B^{2} y, T^{2} y, z, k t\right)$,
$\left.\mathrm{M}\left(\mathrm{T}^{2} \mathrm{y}, \mathrm{A}^{2} \mathrm{x}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0$
Then $\mathrm{A}, \mathrm{B}, \mathrm{T}$ and S have a unique common fixed point in X .

Proof: Let $\mathrm{x}_{0} \in \mathrm{X}$. By (i),there exist $\mathrm{x}_{1}, \mathrm{x}_{2} \in \mathrm{X}$ such that

$$
\mathrm{A}^{2} \mathrm{x}_{1}=\mathrm{T}^{2} \mathrm{x}_{1} \text { and } \mathrm{B}^{2} \mathrm{x}_{2}=\mathrm{S}^{2} \mathrm{x}_{2}
$$

In this way, we can construct two sequences $\left\{\mathrm{X}_{\mathrm{n}}\right\}$ and $\left\{y_{n}\right\}$ in $X$ such that for $=1,2,3, \ldots$

$$
\begin{aligned}
& y_{2 n+1}=A^{2} x_{2 n}=T^{2} x_{2 n+1}, \\
& y_{2 n+2}=B^{2} x_{2 n+1}=S^{2} x_{2 n+2}
\end{aligned}
$$

Now using condition (iv-a) for any $z \in X$, with $x=x_{2 n}, y=x_{2 n+1}$, we get,
$\mathrm{F}\left\{\mathrm{M}\left(\mathrm{A}^{2} \mathrm{x}_{2 \mathrm{n}}, \mathrm{B}^{2} \mathrm{x}_{2 \mathrm{n}+1}, \mathrm{z}, \mathrm{kt}\right)\right.$,
$\mathrm{M}\left(\mathrm{T}^{2} \mathrm{x}_{2 \mathrm{n}+1}, \mathrm{~S}^{2} \mathrm{x}_{2 \mathrm{n}}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{A}^{2} \mathrm{x}_{2 \mathrm{n}}, \mathrm{T}^{2} \mathrm{x}_{2 \mathrm{n}+1}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{B}^{2} \mathrm{x}_{2 \mathrm{n}+1}, \mathrm{~T}^{2} \mathrm{x}_{2 n+1}, \mathrm{z}, \mathrm{kt}\right)$,
$\left.\mathrm{M}\left(\mathrm{T}^{2} \mathrm{x}_{2 \mathrm{n}+1}, \mathrm{~A}^{2} \mathrm{x}_{2 \mathrm{n}}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0$,
That is,
$F\left\{M\left(y_{2 n+1}, y_{2 n+2}, z, k t\right)\right.$,
$\mathrm{M}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}+1}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{y}_{2 \mathrm{n}+2}, \mathrm{y}_{2 \mathrm{n}+1}, \mathrm{z}, \mathrm{kt}\right)$,
$\left.\mathrm{M}\left(\mathrm{y}_{2 \mathrm{n}+1}, \mathrm{y}_{2 \mathrm{n}+1}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0$.
By condition 2.3(a),
$M\left(y_{2 n+2}, y_{2 n+1}, z, k t\right) \geq M\left(y_{2 n+1}, y_{2 n}, z, t\right)$
Thus by lemma 2.5, $\left\{\mathrm{y}_{\mathrm{n}}\right\}$ is a Cauchy sequence. By completeness of $X$, there exists $p$ in $X$ such that $\left\{\mathrm{y}_{\mathrm{n}}\right\}$ converges to p . Hence its subsequence's $\left\{\mathrm{A}^{2} \mathrm{x}_{2 \mathrm{n}}\right\}$, $\left\{\mathrm{B}^{2} \mathrm{x}_{2 \mathrm{n}+1}\right\}$, $\left\{\mathrm{T}^{2} \mathrm{x}_{2 \mathrm{n}+1}\right\}$ and $\left\{S^{2} \mathbf{x}_{2 n+2}\right\}$ also converge to p .

By (iii) $\mathrm{T}(\mathrm{X})$ is complete, therefore, $p \in T(X)$, thus there exists $u \in X$ such that $\mathrm{p}=\mathrm{T}^{2} \mathrm{u}$.
Now put, $x=x_{2 n}$ and $y=u$ in (iv), we get for every $z \in X$,

$$
\mathrm{F}\left\{\mathrm{M}\left(\mathrm{~A}^{2} \mathrm{x}_{2 \mathrm{n}}, \mathrm{~B}^{2} \mathrm{u}, \mathrm{z}, \mathrm{kt}\right),\right.
$$

$\mathrm{M}\left(\mathrm{T}^{2} \mathrm{u}, \mathrm{S}^{2} \mathrm{x}_{2 \mathrm{n}}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{A}^{2} \mathrm{x}_{2 \mathrm{n}}, \mathrm{T}^{2} \mathrm{u}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{B}^{2} \mathrm{u}, \mathrm{T}^{2} \mathrm{u}, \mathrm{z}, \mathrm{kt}\right)$, $\left.\mathrm{M}\left(\mathrm{T}^{2} \mathrm{u}, \mathrm{A}^{2} \mathrm{x}_{2 \mathrm{n}}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0$,
Taking limit $\mathrm{n} \rightarrow \infty$, we get
F $\left\{\mathrm{M}\left(\mathrm{p}, \mathrm{B}^{2} \mathrm{u}, \mathrm{z}, \mathrm{kt}\right)\right.$,
$\mathrm{M}(\mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{t})$,
$\mathrm{M}(\mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{t})$,
$\mathrm{M}\left(\mathrm{B}^{2} \mathrm{u}, \mathrm{p}, \mathrm{z}, \mathrm{kt}\right)$,
$\mathrm{M}(\mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{t})\} \geq 0$,
$\mathrm{F}\left\{\mathrm{M}\left(\mathrm{p}, \mathrm{B}^{2} \mathrm{u}, \mathrm{z}, \mathrm{kt}\right), 1,1\right.$,

$$
\left.\mathrm{M}\left(\mathrm{~B}^{2} \mathrm{u}, \mathrm{p}, \mathrm{z}, \mathrm{kt}\right), 1\right\} \geq 0
$$

So that by 2.3(b),
$\left.\mathrm{M}\left(\mathrm{B}^{2} \mathrm{u}, \mathrm{p}, \mathrm{z}, \mathrm{kt}\right), 1\right\} \geq 1$
Hence, $p=B^{2} u=T^{2} u$.
Using weak ${ }^{* *}$ commutatively of the pair
(T, B), we have

$$
\begin{aligned}
& M\left(T^{2} B^{2} u, B^{2} T^{2} u, z, t\right) \\
& \geq M\left(T^{2} B u, B^{2} T u, z, t\right) \\
& \quad \geq M\left(\operatorname{TB}^{2} u, B^{2} u, z, t\right) \\
& \quad \geq M(T B u, B T u, z, t) \\
& \geq M\left(T^{2} u, B^{2} u, z, t\right)
\end{aligned}
$$

Hence, $T^{2} B^{2} u=T^{2} S^{2} u$, therefore by (3.1)

$$
\begin{equation*}
\mathrm{T}^{2} \mathrm{p}=\mathrm{B}^{2} \mathrm{p} \tag{3.2}
\end{equation*}
$$

Now we put $x=x_{2 n}$ and $y=p$ in (iv), we get for every $\mathrm{z} \in \mathrm{X}$,

$$
\begin{gathered}
F\left\{\begin{array}{c}
\mathrm{M}\left(\mathrm{~A}^{2} \mathrm{x}_{2 n}, \mathrm{~B}^{2} \mathrm{p}, \mathrm{z}, \mathrm{kt}\right), \\
\mathrm{M}\left(\mathrm{~T}^{2} \mathrm{p}, \mathrm{~S}^{2} \mathrm{x}_{2 n}, \mathrm{z}, \mathrm{t}\right), \\
\mathrm{M}\left(\mathrm{~A}^{2} \mathrm{x}_{2 n}, \mathrm{~T}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right), \\
\mathrm{M}\left(\mathrm{~B}^{2} \mathrm{p}, \mathrm{~T}^{2} \mathrm{p}, \mathrm{z}, \mathrm{kt}\right), \\
\left.\mathrm{M}\left(\mathrm{~T}^{2} \mathrm{p}, \mathrm{~A}^{2} \mathrm{x}_{2 n}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0, \\
\text { Taking limit } \mathrm{n} \rightarrow \infty, \text { we get } \\
\mathrm{F}\{
\end{array} \mathrm{M}\left(\mathrm{p}, \mathrm{~B}^{2} \mathrm{p}, \mathrm{z}, \mathrm{kt}\right),\right. \\
\mathrm{M}\left(\mathrm{~T}^{2} \mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{t}\right), \\
\mathrm{M}\left(\mathrm{p}, \mathrm{~T}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right), \\
\mathrm{M}\left(\mathrm{~B}^{2} \mathrm{p}, \mathrm{~T}^{2} \mathrm{p}, \mathrm{z}, \mathrm{kt}\right), \\
\left.\mathrm{M}\left(\mathrm{~T}^{2} \mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0,
\end{gathered}
$$

This gives by using (3.2)
$\mathrm{F}\left\{\mathrm{M}\left(\mathrm{p}, \mathrm{B}^{2} \mathrm{p}, \mathrm{z}, \mathrm{kt}\right)\right.$, M ( $\left.B^{2} p, p, z, t\right)$, $\mathrm{M}\left(\mathrm{p}, \mathrm{B}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right)$, $\left.1, \mathrm{M}\left(\mathrm{B}^{2} \mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0$.
Since $F$ is non decreasing in first argument, we have

$$
\begin{aligned}
& \mathrm{F}\left\{\mathrm{M}\left(\mathrm{p}, \mathrm{~B}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right), \mathrm{M}\left(\mathrm{~B}^{2} \mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{t}\right)\right. \\
& \left.\quad \mathrm{M}\left(\mathrm{p}, \mathrm{~B}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right), 1, \mathrm{M}\left(\mathrm{~B}^{2} \mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{t}\right)\right\} \\
& \geq 0 .
\end{aligned}
$$

Therefore by 7-2-3(b), we have
$\mathrm{M}\left(\mathrm{p}, \mathrm{B}^{2} \mathrm{p}, \quad \mathrm{z}, \mathrm{t}\right) \geq 1$
Hence, $p=B^{2} p=T^{2} p$
Since, $B(X) \subset S(X)$, there exists $v \in X$ such that
$p=B^{2} p=S^{2} v$.
Put $x=v$ and $y=p$ in (iv), we get
$\mathrm{F}\left\{\mathrm{M}\left(\mathrm{A}^{2} \mathrm{v}, \mathrm{B}^{2} \mathrm{p}, \mathrm{z}, \mathrm{kt}\right)\right.$,
$\mathrm{M}\left(\mathrm{T}^{2} \mathrm{p}, \mathrm{S}^{2} \mathrm{v}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{A}^{2} \mathrm{v}, \mathrm{T}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{B}^{2} \mathrm{p}, \mathrm{T}^{2} \mathrm{p}, \mathrm{z}, \mathrm{kt}\right)$,
$\left.\mathrm{M}\left(\mathrm{T}^{2} \mathrm{p}, \mathrm{A}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0$,
That is,

$$
\begin{gathered}
\mathrm{F}\left\{\mathrm{M}\left(\mathrm{~A}^{2} \mathrm{v}, \mathrm{p}, \mathrm{z}, \mathrm{kt}\right),\right. \\
\mathrm{M}(\mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{t}),
\end{gathered}
$$

$\mathrm{M}\left(\mathrm{A}^{2} \mathrm{v}, \mathrm{p}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}(\mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{kt})$,
$\left.\mathrm{M}\left(\mathrm{p}, \mathrm{A}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0$,
Since $F$ is non decreasing in first argument, we have

F $\left\{\mathrm{M}\left(\mathrm{A}^{2} \mathrm{v}, \mathrm{p}, \mathrm{z}, \mathrm{t}\right), 1, \mathrm{M}\left(\mathrm{A}^{2} \mathrm{v}, \mathrm{p}, \mathrm{z}, \mathrm{t}\right)\right.$, $\left.1, \mathrm{M}\left(\mathrm{p}, \mathrm{A}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0$,
Therefore by 7-2-3(b), we have

$$
\begin{equation*}
\mathrm{M}\left(\mathrm{p}, \mathrm{~A}^{2} \mathrm{v}, \mathrm{z}, \mathrm{t}\right) \geq 1 \tag{3.4}
\end{equation*}
$$

Hence, $p=A^{2} v=S^{2} v$.
Using weak** commutatively of the pair ( $\mathrm{S}, \mathrm{A}$ ), we have

$$
\begin{aligned}
& \mathrm{M}\left(\mathrm{~S}^{2} \mathrm{~A}^{2} v, A^{2} S^{2} v, \mathrm{z}, \mathrm{t}\right) \\
& \geq \mathrm{M}\left(\mathrm{~S}^{2} A v, A^{2} S v, \mathrm{z}, \mathrm{t}\right) \\
& \geq \mathrm{M}\left(\mathrm{SA}^{2} v, A S^{2} v, \mathrm{z}, \mathrm{t}\right) \\
& \geq \mathrm{M}\left(\mathrm{SAv}^{2}, A S v, \mathrm{z}, \mathrm{t}\right) \\
& \geq \mathrm{M}\left(\mathrm{~S}^{2} v, A^{2} v, \mathrm{z}, \mathrm{t}\right)
\end{aligned}
$$

Hence, $S^{2} A^{2} v=A^{2} S^{2} v$, therefore by (3.4)

$$
\begin{equation*}
S^{2} p=A^{2} p \tag{3.5}
\end{equation*}
$$

Now we put $x=p$ and $y=x_{2 n+1}$ in (iv), we get for every $\mathrm{z} \in \mathrm{X}$,

$$
\begin{aligned}
& \mathrm{F}\{ \mathrm{M}\left(\mathrm{~A}^{2} \mathrm{p}, \mathrm{~B}^{2} \mathrm{x}_{2 n+1}, \mathrm{z}, \mathrm{kt}\right), \\
& \mathrm{M}\left(\mathrm{~T}^{2} \mathrm{x}_{2 n+1}, \mathrm{~S}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right), \\
& \mathrm{M}\left(\mathrm{~A}^{2} \mathrm{p}, \mathrm{~T}^{2} \mathrm{x}_{2 n+1}, \mathrm{z}, \mathrm{t}\right) \\
& \mathrm{M}\left(\mathrm{~B}^{2} \mathrm{x}_{2 n+1}, \mathrm{~T}^{2} \mathrm{x}_{2 n+1}, \mathrm{z}, \mathrm{kt}\right), \\
&\left.\mathrm{M}\left(\mathrm{~T}^{2} \mathrm{x}_{2 n+1}, \mathrm{~A}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0,
\end{aligned}
$$

Taking limit $\mathrm{n} \rightarrow \infty$, we get

$$
\mathrm{F}\left\{\mathrm{M}\left(\mathrm{~A}^{2} \mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{kt}\right),\right.
$$

$\mathrm{M}\left(\mathrm{p}, \mathrm{S}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{A}^{2} \mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{t}\right)$,
M (p, p, z, kt),
$\left.\mathrm{M}\left(\mathrm{p}, \mathrm{A}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0$,
Using (3.5), we have

$$
\begin{gathered}
\mathrm{F}\left\{\mathrm{M}\left(\mathrm{~A}^{2} \mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{kt}\right),\right. \\
\mathrm{M}\left(\mathrm{p}, \mathrm{~A}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right) \\
\mathrm{M}\left(\mathrm{~A}^{2} \mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{t}\right) \\
\left.1, \mathrm{M}\left(\mathrm{p}, \mathrm{~A}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0,
\end{gathered}
$$

Since $F$ is non decreasing in first argument, we have

F $\left\{\mathrm{M}\left(\mathrm{A}^{2} \mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{t}\right)\right.$,
$\mathrm{M}\left(\mathrm{p}, \mathrm{A}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right)$, $\mathrm{M}\left(\mathrm{A}^{2} \mathrm{p}, \mathrm{p}, \mathrm{z}, \mathrm{t}\right)$, $\left.1, \mathrm{M}\left(\mathrm{p}, \mathrm{A}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0$,
Therefore by 7-2-3(b), we have $\mathrm{M}\left(\mathrm{p}, \mathrm{A}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right) \geq 1$
Hence, $p=A^{2} p=S^{2} p$,
Therefore by (3.3),

$$
\begin{equation*}
\mathrm{p}=\mathrm{A}^{2} \mathrm{p}=\mathrm{B}^{2} \mathrm{p}=\mathrm{S}^{2} \mathrm{p}=\mathrm{T}^{2} \mathrm{p} \tag{3.6}
\end{equation*}
$$

Now put $x=A p$ and $y=p$ in (iv), we get

$$
\mathrm{F}\left\{\mathrm{M}\left(\mathrm{~A}^{2} \mathrm{Ap}, \mathrm{~B}^{2} \mathrm{p}, \mathrm{z}, \mathrm{kt}\right)\right.
$$

$\mathrm{M}\left(\mathrm{T}^{2} \mathrm{p}, \mathrm{S}^{2} \mathrm{Ap}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{A}^{2} \mathrm{Ap}, \mathrm{T}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{B}^{2} \mathrm{p}, \mathrm{T}^{2} \mathrm{p}, \mathrm{z}, \mathrm{kt}\right)$,
$\left.\mathrm{M}\left(\mathrm{T}^{2} \mathrm{p}, \mathrm{A}^{2} \mathrm{Ap}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0$,

Since (A, S) is weak** commutative, therefore $S^{2} \mathrm{Ap}=\mathrm{AS}^{2} \mathrm{p}$, we have using (3.6)

F\{M(Ap, p, z, kt),
M (p, Ap, z, t),
M (Ap, p, z, t),
M (p, p, z, kt),
$\mathrm{M}(\mathrm{p}, \mathrm{Ap}, \mathrm{z}, \mathrm{t})\} \geq 0$,
That is
$\mathrm{F}\{\mathrm{M}(\mathrm{Ap}, \mathrm{p}, \mathrm{z}, \mathrm{kt}), \mathrm{M}(\mathrm{p}, \mathrm{Ap}, \mathrm{z}, \mathrm{t})$, M (Ap, p,z,t), 1,M (p, Ap, z,t) $\} \geq 0$,
Since $F$ is non decreasing in first argument, we have
$\mathrm{F}\{\mathrm{M}(\mathrm{Ap}, \mathrm{p}, \mathrm{z}, \mathrm{t}), \mathrm{M}(\mathrm{p}, \mathrm{Ap}, \mathrm{z}, \mathrm{t})$, $\mathrm{M}(\mathrm{Ap}, \mathrm{p}, \mathrm{z}, \mathrm{t}), 1, \mathrm{M}(\mathrm{p}, \mathrm{Ap}, \mathrm{z}, \mathrm{t})\} \geq 0$,
Therefore by 2.3(b), we have

$$
\mathrm{M}(\mathrm{p}, \mathrm{Ap}, \mathrm{z}, \mathrm{t})\} \geq 1
$$

Hence, $p=A p$. Similarly we can show that $p=B p, p=T p, p=S p$. This shows that $p$ is common fixed point of $\mathrm{A}, \mathrm{B}, \mathrm{T}$ and S .

Uniqueness: Let p and q be two common fixed points of $\mathrm{A}, \mathrm{B}, \mathrm{T}$ and S .
Put $x=p$ and $y=q$ in (iv) we get
$\mathrm{F}\left\{\mathrm{M}\left(\mathrm{A}^{2} \mathrm{p}, \mathrm{B}^{2} \mathrm{q}, \mathrm{z}, \mathrm{kt}\right)\right.$,
$\mathrm{M}\left(\mathrm{T}^{2} \mathrm{q}, \mathrm{S}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{A}^{2} \mathrm{p}, \mathrm{T}^{2} \mathrm{q}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{B}^{2} \mathrm{q}, \mathrm{T}^{2} \mathrm{q}, \mathrm{z}, \mathrm{kt}\right)$,
$\left.\mathrm{M}\left(\mathrm{T}^{2} \mathrm{q}, \mathrm{A}^{2} \mathrm{p}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0$,
Using (3.6) we have
$\mathrm{F}\{\mathrm{M}(\mathrm{p}, \mathrm{q}, \mathrm{z}, \mathrm{kt})$,
$\mathrm{M}(\mathrm{q}, \mathrm{p}, \mathrm{z}, \mathrm{t})$,
$\mathrm{M}(\mathrm{p}, \mathrm{q}, \mathrm{z}, \mathrm{t})$,
M (q, q, z, kt),
$\mathrm{M}(\mathrm{q}, \mathrm{p}, \mathrm{z}, \mathrm{t})\} \geq 0$,
That is

$$
\mathrm{F}\{\mathrm{M}(\mathrm{p}, \mathrm{q}, \mathrm{z}, \mathrm{kt}), \mathrm{M}(\mathrm{q}, \mathrm{p}, \mathrm{z}, \mathrm{t}),
$$

$\mathrm{M}(\mathrm{p}, \mathrm{q}, \mathrm{z}, \mathrm{t}), 1, \mathrm{M}(\mathrm{q}, \mathrm{p}, \mathrm{z}, \mathrm{t})\} \geq 0$,
Since $F$ is non decreasing in first argument, we have

$$
\mathrm{F}\{\mathrm{M}(\mathrm{p}, \mathrm{q}, \mathrm{z}, \mathrm{t}), \mathrm{M}(\mathrm{q}, \mathrm{p}, \mathrm{z}, \mathrm{t}),
$$

$\mathrm{M}(\mathrm{p}, \mathrm{q}, \mathrm{z}, \mathrm{t}), 1, \mathrm{M}(\mathrm{q}, \mathrm{p}, \mathrm{z}, \mathrm{t})\} \geq 0$,
Therefore
$\mathrm{M}(\mathrm{q}, \mathrm{p}, \mathrm{z}, \mathrm{t})\} \geq 0$
Hence, $\mathrm{p}=\mathrm{q}$. This proves that $\mathrm{A}, \mathrm{B}, \mathrm{T}$ and S have unique common fixed point.
By taking $\mathrm{A}=\mathrm{UV}$ and $\mathrm{B}=\mathrm{WP}$ in the proof of theorem 3, we have the following result.

Theorem 4. Let U, V, W, P, T and S be self mappings on a complete fuzzy 2-metric space (X, M, *) satisfying the following
(i) $\mathrm{UV}(\mathrm{X}) \subset \mathrm{T}(\mathrm{X}), \mathrm{WP}(\mathrm{X}) \subset \mathrm{S}(\mathrm{X})$,
(ii) The pairs (UV,S) and (WP,T) are weak** commutative.
(iii) $T(X)$ and $S(X)$ are complete.
(iv) For some $\mathrm{F} \in \Phi$, there exists $\mathrm{k} \in(0,1)$ such that for all x ,
$y, z \in X$ and $t>0$,
$\mathrm{F}\left\{\mathrm{M}\left(\mathrm{U}^{2} \mathrm{~V}^{2} x, W^{2} \mathrm{P}^{2} \mathrm{y}, \mathrm{z}, \mathrm{kt}\right)\right.$,
$\mathrm{M}\left(\mathrm{T}^{2} \mathrm{y}, \mathrm{S}^{2} \mathrm{x}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{U}^{2} \mathrm{~V}^{2} \mathrm{x}, \mathrm{T}^{2} \mathrm{y}, \mathrm{z}, \mathrm{t}\right)$,
$\mathrm{M}\left(\mathrm{W}^{2} \mathrm{P}^{2} \mathrm{y}, \mathrm{T}^{2} \mathrm{y}, \mathrm{z}, \mathrm{kt}\right)$,
$\left.\mathrm{M}\left(\mathrm{T}^{2} \mathrm{y}, \mathrm{U}^{2} \mathrm{~V}^{2} \mathrm{x}, \mathrm{z}, \mathrm{t}\right)\right\} \geq 0$

Then $\mathrm{U}, \mathrm{V}, \mathrm{W}, \mathrm{P}, \mathrm{T}$ and S have a unique common fixed point in X .
