ABSTRACT: The present work deals with a collection of soil oribatid mites from some selected habitat of five districts of Konkan Region of the Maharashtra state. 18 species, 17 genera belonging to 13 families of soil oribatid mites were recorded from the present investigation. As this region is totally unexplored all the species and genera found are new records from the Maharashtra state with 2 new records from India.

Key words: Oribatid mites, Konkan region, Maharashtra, new records.

INTRODUCTION

Although tiny themselves, mites belong to most impressive lineage of animals, the arthropods. They are ubiquitous in every sort of aquatic, terrestrial, arboreal and parasitic habitat but, being among the smallest arthropods, even those inhabiting well studied systems are often overlooked. It is estimated that there are about 9000 species of soil oribatid mites belonging to 800 genera are presently known from the world.

When compared the state Maharashtra is so far known to comprise only 4 Oribatid species belonging to 3 genera and 2 families as against 2186 species belonging to 643 genera and 207 families reported from India. Narsapur (1983) made the first record of Oribatid mite from Maharashtra from the soils of the state. Later Sanyal (1984) studied soil mites of Maharashtra and published one paper containing description of two new species. No work has been done on soil oribatid mites after that.

The present paper is based on a Collection of soil oribatid mites from the Konkan region of the state Maharashtra. An account of 18 species, 17 genera belonging to 13 families are provided here, with details of collection data. The oribatid fauna of this region is practically unexplored and the present account will form a basis for future research on this group from the area.

Konkan division is one of the six administrative divisions of Maharashtra state in India. It comprises the Konkan region, which occupies the entire west coast of Maharashtra. The two districts in the state capital Mumbai also fall in Konkan division. The total area comprises 30,746 km² and districts Mumbai, Mumbai Suburban, Raigad, Ratnagiri, Sindhudurg and Thane. Collections were made from soil and litter from different habitats.

MATERIAL AND METHODS

For taxonomic studies of oribatid mites, litter, soil and humus samples from all possible habitats were collected. The samples Collected by shovel from upper 10 cm soil profile were kept in polythene bags. The samples were extracted by using modified Tullgren funnels and extracted mite specimens were collected in glass tubes containing 70% alcohol.

The body of most of the oribatid mite is heavily sclerotized and opaque. The extracted material were made ready for taxonomic study following the usual procedure of keeping the specimen in solution of 90% alcohol and lactic acid (v/v) as advocated by Balogh (1965). For microscopic observations, Balogh's (1965) method of temporary mounting in lactic acid was followed. After necessary microscopic observations the specimen was transferred in small glass vials containing 90% alcohol. The vials were then properly labelled and stored.

The specimens were studied under Nikon Eclipse, 50i microscope. In this study, the classification proposed by Balogh (1972) has been followed.

All specimens are deposited in the National Zoological Collections of Zoological Survey of India, HQs., Kolkata.

Study Area: The districts of Konkan Region (Marked in red) of Maharashtra were surveyed.

RESULTS

SYSTEMATIC ACCOUNT

1. Family: PHTHIRACARIDAE Perty, 1841

1. Genus: *Hoplophorella* Berlese, 1923
