(Received 08 April, 2014, Accepted 23 May, 2014)

ABSTRACT: A check list of hawk moths collected from North-West Himalaya and preserved in National PAU Insect Museum, Ludhiana is being represented. 30 species belonging to 20 genera of family Sphingidae have been identified. The paper gives details regarding distribution and synonymy of all these species.

Keywords: Collection, Himalaya, moths, Lepidoptera, Sphingidae

INTRODUCTION

Lepidoptera (moths, butterflies and skippers) includes scaly winged insects is the third largest order after Coleoptera and Hymenoptera in the class Insecta. Sphingidae is one of the family in this order are present. Otherwise family Sphingidae is represented by as many as 1354 species and subspecies on world basis, out of which 204 species belong to India (Hampson, 1892; Bell and Scott, 1937; Roonwal *et. al* 1964; D' Abrera, 1986). As part of the biosystematic studies, inventorization on Sphingid moth diversity was undertaken at the taxonomy laboratory, Department of Entomology, Punjab Agricultural University, Ludhiana. Survey- cum-collection tours were undertaken from various localities such as Jammu, Srinagar, Pahalgan, Katra (Jammu and Srinagar), Manali, Mandi, Kullu, Hamirpur, Palampur, Kangra, Pathankot, Una, Bilaspur, Shimla, Solan, Dharmpur, Dagshai, YSP Univ. Nauni, Sabathu, Kasauli, Kumarhatti, Ochghat, Chambaghat, Barog, Salogra, Dedgharat, Kandhagarhat, Waknaghant, Yashwant Nagar, Gaura, Rajgarh, Badu sahib, Renuka (Himachal Pradesh), Dehradun Vikasnagar, Haridwar, Rishikesh, Karanparyag, Ruderpariyag (Uttarakhand) during different seasons were examined. The details on their distribution of different species/ genera collected from various localities of North- West Himalaya and those preserved in the National PAU Insect Museum, PAU, Ludhiana are also provided. The Hawk- moths are among the most familiar and best known of Lepidoptera with streamlined adults and horned larvae are the characteristics of the family Sphingidae.

In all, 30 species belonging to 20 genera of family Sphingidae has been identified and studied.

MATERIAL AND METHODS

The collected moths were killed by using ethyl acetate, pinned, stretched and preserved in well-fumigated wooden boxes. The standard technique given by Robinson (1976) and Zimmerman (1978), Klots (1970) were followed for wing venation and genitalia, respectively of specimens. All illustrations were made by using camera lucida attached to a zoom stereo microscope and photographs of the adults were taken prior to dissection.

RESULTS AND DISCUSSION

The result of these survey-cum-collection tours led to the collections of about 408 specimens belonging to 30 species of 20 genera of family Sphingidae. The lists of all the identified species are provided below. The study involved examination of various morphological characters such as antennae, labial palpi, legs, and wing venation and wing maculation. The other technique in biosystematic studies has been utilized by dissecting/studying their external male and female genitalic characters. The authentic identification was done by comparisons with the collections lying at different National Museums like National Pusa Collections, IARI, New Delhi, FRI Dehradun and ZSI Kolkatta.

OBSERVATIONS

SUB FAMILY: SPHINGINAE

1. Genus: Acherontia [Laspeyres], 1809, *Jena.*
Allg.Lit.-Ztg 4 (240): 100.

Type species: *Sphinx atropos* Linnaeus, 1758, *Syst. Nat.* (Edn 10)1:489, by original designation. Ochsenheimer, 1808, *Schmett. Eur.* 2:183-256, divided the genus *sphinx* Linnaeus, 1758, into five sections, which he termed Families. In an anonymous review, later attributed to Ochsenheimer (1816, *Schmett. Eur.* 4: v) to Laspeyres, the four species included in Ochsenheimer's Family IV were separated into two genera; three species were placed in *Sphinx*, and *Acherontia* was proposed for *Atropos*.

Material examined: 3♂ 1♀, India: Pynursia, 06.vi.2013, P.C. Pathania, R. Kumar, S. Sharma (1♂); Serighat, 13.vii.2013, P.C. Pathania, A. Kumar (1♂); Solan, 14.vii.2013, P.C. Pathania, A. Kumar (1♂, 1♀).

2. Genus: Agrius Hubner, [1819] 1816, *Verz. Bekannt Schmett.*:140.

Type-species: *Sphinx cingulata* Fabricius, 1775, *Syst. Ent.*:545, by subsequent designation by Tutt, 1902, *Nat. Hist. Br. Lepid.3:* 355. [CANADA to ARGENTINA] America. Tutt stated incorrectly that the type of *Agrius* Hubner, [1819], had been fixed as *cingulata* by Hubner *ante* 1826'. Tutt's statement, however, satisfies the provision of Article 69 (a) (iii) of the *Code* which states that "...an author is considered to have designation one of the originally included nominal species as type- species, if he states that it is the type (or type-species), for what reason, right or wrong, and if it is clear he himself accepts it as the type- species". Incorrect type-species designation: *Agrius eremitus* Hubner, [1823], a name not originally included in *Agrius*, and not linked with one of the originally included names when designated by Grote, 1873, *Bull. Buffalo Soc. Nat. Sci.* 1:26.

ACKNOWLEDGEMENTS

We are very thankful to UGC, New Delhi for funding the project and also to our worthy Vice-Chancellor and Head, Department of Entomology for providing necessary research facilities. Authors would like to thank Dr. V.V. Ramamurthy (Principal Scientist) for their help in consultation of the National Pusa collection housed at Indian Agricultural Research Institute, New Delhi.
