**ABSTRACT:** *Macroptilium atropurpureum* (Moç. & Sessé ex DC.) Urb., is earlier known only from Delhi, North India and Maharashtra in Western India is recorded for the first time from the Gujarat State. A detailed description and a photograph are provided.

**Keywords:** *Macroptilium atropurpureum*, New Record, Gujarat

### **INTRODUCTION**

*Macroptilium* (Benth.) Urb. a tropical American genus, introduced and cultivated elsewhere; represented by c. 20 species, of which 2 species are so far reported from India (Sanjappa, 1992). During recent field visits in backyard of FES Campus, Anand district in Gujarat, India, the authors have collected specimens of a species of this genus. On critical examination and perusal of literature (Patel, 1971; Shah, 1978; Raghavan *et al.*, 1981; Shetty *et al.*, 1987; Singh *et al.*, 2000; Sanjappa, 1922), it was identified as *Macroptilium atropurpureum* (Moç. & Sessé ex DC.) Urb., hitherto known from Delhi and Maharashtra. Therefore, the present collection is a new distributional record for Gujarat State.

*Macroptilium atropurpureum* (Moç. & Sessé ex DC.) Urb. Symb. Antill. 9: 457 (1928); Sanjappa, Legumes of India 206 (1991). *Phaseolus atropurpureus* DC. Prodr. 2: 395 (1825).

Twining or creeping perennial, ± densely hairy herbs. Stems rooting at the nodes, densely covered with fine retrorse hairs. Leaves pinnately 3-foliolate; leaflets 1.0–5.0 × 1.5–5.0 cm, broadly ovate or rhombic, the laterals often lobed on the outer side, pubescent above, silvery velvety beneath; petiole 0.5–5 cm long;

stipules 4–5 mm long, ovate-acuminate, strongly veined. Inflorescences lax, 10–30 cm long, long-pedunculate, erect; bracteoles 2–3 mm long, linear. Calyx 7–8 mm long, tubular; lower lobes 2–3 mm long, narrowly triangular. Corolla 17–20 mm long; wings blackish-purple. Pod 6–9 × 0.3–0.4 cm, linear, beaked, densely appressed-pubescent, c.12–15-seeded. Seeds marbled brown and black, 4 mm long, oblong-ellipsoid, pitted.

**Flowering & Fruiting:** February–May

**Distribution:** Widely naturalized in Anand district of Gujarat state in disturbed habitat, most often in cultivated fields.

**Specimens examined:** SLP 1826, 1827 (Jahangirpura), 1828, 1829 (Khambhat).

**Note:** In general appearance the species has grayish leaves, erect peduncles and looks generally like a very dark, almost black-flowered *Vigna*.

### **ACKNOWLEDGMENTS**

We are grateful to Executive director, Mr. Jagadish Rao and Deputy Director, Mr. Dinesh Reddy for their support and encouragement during the research.
