ABSTRACT: The paper emphasizes the link between processes of vernacular and current architecture practices. With examples in Bangalore, the paper demonstrates how process and making is important in vernacular and current design practices. How vernacular is not stagnant but is manifested in the current architecture practices through processes of making. The paper intends to investigate the importance and link between vernacular and current architecture forms by analyzing examples of houses and other buildings from late 19th century and setting them against houses currently designed by architects. The paper will look at the tectonics and process of creation that were employed in vernacular buildings in Bangalore region. The vernacular is always associated with something that is not 'conventional'. That which is not scalable or usable in current practices of architecture and even looked down by designers as just something, which has a visual charm but nothing more. On the contrary there are interesting tactile and tectonic processes that provide a basis for architectural design practices today. The area of study is Bangalore. Bangalore city has houses, which use earth, stone, brick and wood and employ traditional methods of construction in the 19th century. These houses are between 100 to 150 years old. These examples illustrate the vernacular processes in the region. The examples juxtaposed against the houses built by architects in the last decade, which use comparable material and ecological concepts show an exciting process overlap between the two. Vernacular processes give the current disarrayed design methodologies a strong toolset, which is investigated in the paper.

Keywords: Vernacular; Process; Current architecture practice; Bangalore

## I. DEFINING VERNACULAR

The etymology of Vernacular comes from the Latin word 'vernaculus' that means native. Vernacular is native, built by people, communities with available resources [3]. Vernacular can also be defined as buildings built with local know-how, refined over generations. In the context of India this includes houses and places of residence, which have always doubled up as space for life stock, community activities and even schools. As Paul Oliver suggests "Although changes over time are to be seen in most building traditions, the persistence of distinct and distinctive building types and forms, of material resources and methods of construction, and of space use and associated values, is undeniable" [3]. These qualities of vernacular make it very relevant in today's context, to provide the current practice a toolset for design.

#### **II. VERNACULAR AND CURRENT PROCESSES**

As Juhani Pallasma (2012) suggests, "architecture should seek deep and permanent essences of human existence instead of obsessively trying to generate a passing experience of newness" [4]. An embodiment of the spirit of tradition becomes important for consequential creativity. Vernacular and the processes of building employed in it can create a sense of real not extreme individuality. Vernacular, many a times is valued just for its visual appeal and the gush it arises because of its rustic and native nature but the real learning and appeal would be in the material, processes and methods it adopts to produce an existential quality, which newness may lack. While most fashionable buildings are expected to be exclusive and bring fresh ideas and exceed the traditional in quality, it remains a question if they really succeed in doing this. New, contemporary architecture is many a times only a different approach to the same existential questions of human kind [4]. Again, looking at tradition or vernacular in a static form would be incorrect. True tradition has to be redevised by each new generation [5]. This continuance and reinvention of the already amassed knowledge of generations should provide the base for the architecture philosophy and style. Traditions are sustained if they have meaning: they may be practical or they may be symbolic, but they are frequently of fundamental significance for the cultures concerned. In vernacular architecture they may be related to the appropriation, preparation and working of certain building materials and resources, which can require specific knowledge and skills [6]. Vernacular practices vary with use of techniques, material available in the vicinity while keeping the environmental balance of the region, and the keeping the demand and supply of resources in a constant balance. Buildings in their form change but building traditions and methods become of greater interest.

# III. VERNACULAR PRACTICES AND TECTONICS

Many academics have recognized the importance of tectonics in architecture. The enhancement of tectonic tradition is an important component in the construction of architecture thought. The architecture style and form is deeply connected to the material and technique employed in buildings [7]. This is true of vernacular and contemporary buildings. Building as a carrier of intrinsic physical properties, related to structure, material, detail, and technique could tell its own story and that makes the link between tectonic and vernacular important for profound buildings [8]. Work done on vernacular architecture mainly concerns detailed account, dating and classification of building forms, materials and technologies. The majority of these studies, if not all of them are historical, dating back to the seventeenth, eighteenth and nineteenth century. Contemporary buildings receive only limited attention, even if they have been built by the owner himself or herself and made by common, ordinary people [8]. A more wholistic approach to vernacular and current architecture would be to focus on the building traditions rather than form and typology.

# IV. TRADITIONAL TECHNIQUES AND MODERN FORM

There are various examples of building in Bangalore region, which have vernacular, colonial and modern influences in its typology, form and material. The process of making them though remains uniform in many building through the 19th and 20th century.

The scope of this study is limited to the first step of defining, identifying vernacular built forms in Bangalore region and tracing the link to current practices. Examples are used to comprehend the background and techniques of construction. Through examples and tracing the methods of construction it would be possible to interpret the processes that were employed in making these and then be compared with the processes of handling and using material, technology and resources in building a house in Bangalore today. The Devanahalli fort area in Bangalore has houses which date back 100 to 150 years and display techniques such as Madras terrace, oxide flooring, local stone and masonry with typology that suited the living and life style of the 19th century. There are other examples in the central business district of Bangalore, the KR Market area which should influences from the vernacular and colonial past.

#### V. HOUSES OF DEVANAHALLI

Devanahalli fort area is unique since it is fortified and the setting of these houses remains constant for study. It is useful to examine the mechanism by which a link between the life style and built form is achieved in vernacular architecture [10].

**Fig. 3.** Typical plan of vernacular houses in Devanahalli with central raised living spaces.

### VI. TYPOLOGY, MATERIAL AND TECHNIQUE

The social environment shapes the typology of these house. The houses sit in a narrow lane with a Jaggali (a front porch that is elevated for sitting and conversing with people walking on the street at eye level.). The plan of the houses is modest with the central largest room higher to bring in light and ventilation, in a site, which is very tight and has no chance of having openings on both the sides. The typology characterizes outer and inner living spaces, which gives hierarchy to the use of spaces by guests and inhabitants. The typology has come about with regard to social life of the inhabitants. Many of the homes have courtyards and invert looking spaces, which is necessary in the climate that it's situated in. Like the present tight urban context, even at this site the adjacent houses are attached and there is no possibility to get light from the sides but raising the inner spaces and providing ventilators have arrived at the solution. A court surrounded by rooms is found in these houses and in most tropical regions. It serves to provide, light, ventilation and privacy in an inward looking plan while doubling up as circulation

space. The roof structure in most of these houses dominate the form.

Fig. 6. Bamboo ceiling of a 'Jaggali'.

The structures are built with locally available granite and wood. The flooring is red oxide with simple patterns to give distinctiveness. Parts of roof are madras terraces, which as the name suggests has been brought from old Madras region in Tamilnadu. The use of Madras terrace is a technique of roofing with bricks, terracotta tiles and lime primarily. This kind of room used local skills and material and also some binders, which were made with local fruits. Some of these houses have used mud roofs with bamboo as reinforcement. Some smaller houses in the are also have mud roofs with bamboo framework. The Bengal terrace, a similar to the Madras terrace technique is interestingly used in many buildings built and commissioned by the British in the 19th century. The St. Andrew's Church on Cubbon road is one such example. Bangalore sees a mix of vernacular and colonial influences in the architecture on 19th century. The 19th century witnessed the industrial revolution and owing to this the mechanization and standardization made quick changes in processes too. Mechanization changed the shared traditions of building practices of the vernacular [11]. This was happening in Bangalore too. The introduction of steel and mechanized production of construction material such as tiles and bricks changed the making of architecture. After the sustainability and ecological architecture movement gained momentum in Bangalore and many other urban centers of the world, the architects have consciously looked at vernacular for solutions. Bangalore has seen constant influence of global trends in construction, which most times are isolated, and not in tune to the real problems that architecture should reflect and solve. In the last few decades' architects have tried to adopt vernacular methods and processes to provide for a more sustainable use of already depleting resources. The techniques are many times adapted to the present time, available resources and technology. The vernacular houses use stone and mud as the two primary materials for walls and roof. Today many architects use the compressed soil block technology, which uses earth blocks compressed instead of burning it. The soil is mixed with a small amount of cement for higher performance. Centre for ASTRA in the Indian Institute of Science developed these blocks in 1970s in Bangalore. The panel roofs are also used in many recent houses to create roofing systems, which use much lesser cement and steel. The framework for these panels is now made with fabricated steel unlike wooden molds used earlier. The useful traditional techniques are adapted with contemporary forms. The techniques and processes form the essence of these sustainable buildings while reinterpreting and providing to the new ways of living.

# **VII. CONCLUSION**

To learn from vernacular built forms, its crucial to focus of the processes and traditions of building. The buildings built by communities, people and families always considered the context and adapted the techniques to the available resources. There is a discrete link between vernacular and current practices of building. The present design practices adapt and take from vernacular processes. The material and context changes many a times though. Vernacular is not obsolete but continuously changes and adapts even in mainstream processes in Bangalore. The building processes provide for a useful toolset for architectural thought. The principles of design are seldom formed by looking at vernacular buildings in academia or in practice in India. The richness and sensibility of vernacular could be readily engaged in design concepts today, instead of borrowing from very different climatic regions and ideologies, which may have little meaning in this context. There is an embedded knowledge in the vernacular buildings around us and this could provide a basis for deign concepts in the present. Bangalore Architects and Engineers, in the last three decades have attempted to learn and integrate from vernacular

### Joseph

building practices in smaller attempts, but processes and 'making' still remain to be actively pursued as a design methodology.
